

# 2024 GTM Benchmarks

Public and private company sales & marketing benchmarks. What's good? What's bad?

The OnlyCFO newsletter has been sponsored by some of the very best finance solutions. I love being sponsored by companies that are very relevant to my audience and can help folks run their companies better.

Today is no different with **Meow**. They help solve real problems faced by every company.

## Today's Sponsor:

**Meow**: Business banking, with interest. (Meow is a financial technology company, not a bank)

When thinking about banking for your business, did you consider whether your checking account pays interest?

It might be easy to forget. Meow finds banks willing to pay **interest on business checking accounts**, not just on idle cash. Some other benefits:

- **Zero wire fees** on checking accounts from Meow's partner banks.
- **Earn up to 5.02% Annual Percentage Yield** subject to **rate sheets** from First

that the most impacted by slowing revenue growth are startups and the least impacted are the large at-scale companies.

	ARR Growth by ARR Size			
	<\$25M	\$25 - 100M	\$100 - 200M	\$200M +
2023 ARR growth	253%	71%	37%	35%
2024 ARR growth	168%	54%	27%	30%
Endurance	66%	76%	73%	86%

For companies <\$25M in ARR, 2024 growth is only 66% of what it was in 2023. Growth for this bucket dropped 85 percentage points over one year!! That is HUGE...

On the other hand, more mature at-scale companies only saw ARR growth decay slightly — 35% growth in 2023 vs 30% in 2024 (86% endurance).

**What does the differences in declining revenue growth tell us?**

Two possible explanations that I see continuing to play out:

- 1. **Fear of buying from startups.** “Nobody got fired by buying from [name a big regarded company]”. Buying from startups for any critical and/or highly visible tool feels A LOT riskier today because of the startup company risk in this environment and buyers are a lot less willing to bet their career on an unproven tool today.
- 2. **Vendor consolidation push.** We are all trying to be more efficient so many orgs are consolidating tools and focusing on larger vendors that can meet several needs versus lots of different point solutions.

Early stage companies need to continue to further de-risk the purchase decision

The below public company benchmark data tells a similar story for mature cloud companies. On the bright side it looks like ARR growth actually started to pick Q2.

[BenchSights](#)

## NRR is Falling

NRR (net revenue retention, aka NDR) has been falling since 2021 for most companies. This NRR story lines up with the overall ARR growth decline discussed above. It's hard to grow fast when the easy expansion opportunities are declining and churn is increasing.

### Top Quartile Net Dollar Retention<sup>1</sup> *By ARR scale*

source: ICONIQ

**Public company benchmarks:** public companies follow a similar pattern. And the bigger they are, the harder they fall — Snowflake's NDR dropped 47 percentage since 2021! That is 47% of easier ARR growth that just vanished.

## LTV/CAC Thoughts

I am generally not a fan of private company LTV/CAC benchmarks for a few reasons:

- For companies with <\$25M in ARR the calculation is usually misleading:
  - Not a fully built out GTM motion so CAC isn't realistic for when you are actually at scale. Startups bragging about their LTV/CAC of 15+ is just s

and CAC numbers

- There are way too many variables in LTV/CAC to make it a useful operating metric.

Understanding the LTV/CAC ratio is important because it is ultimately what drives cloud valuations, but don't over analyze it. In many ways the LTV/CAC ratio is like the discounted cash flow (DCF) model - in theory it is perfect, but in practice it is all very wrong.

## Contract Term Length is Increasing

I actually found the below a bit surprising - contract terms are increasing. Most companies I speak with are trying to limit multi-year contracts on the vendor side.

Manage

Reject

Accept

sign multi-year deals with large companies.

source: ICONIQ

**My contract term length policy:** any new vendor must be one year max (with very exception) and then we can consider multi-year if certain criteria are met:

- Discount for multi-year is worth it
- Software is critical
- Internal champion signs in blood that they need it and won't switch
- Confidence in vendor and roadmap/innovation

## CAC Ratio

The CAC (customer acquisition cost) ratio has skyrocketed since 2021. The below chart from BenchSights shows the CAC ratio for public cloud companies.

Accept

BenchSights

In Q1 2021 it cost public cloud companies \$1.61 to acquire \$1.00 in ARR, but to costs them \$2.26 for \$1.00 in ARR. That is a 40% increase!

## Sales Attainment

A big reason for this massive CAC increase is the drop in sales rep attainment. V sales reps are beating quota everyone is happy because not only are sales reps making piles of money, but each incremental dollar in sales is much more efficient.

Large company quota attainment has continued to decline while smaller companies sales quota attainment has started to recover.

# Benchmarking Caveats

When comparing benchmarks, it's important to consider the population and firmographics of the benchmark data before trying to compare. Benchmark data is usually separated by:

1. Public company
2. Private company

## Public Company:

When comparing public companies data then of course you can just use the publicly available data sets of the most relevant companies. It is important to consider revenue scale and other company specific factors when making comparisons.

## Private Company:

Private company benchmark data is not as straightforward though because of the following:

- **They don't have individual company data** so you don't really know what you are comparing against. For example, some benchmark reports just show top quartile metrics. Companies are often not top quartile in every metric so if you compare all the top quartile benchmarks your expectations may be unrealistic
- **High diversity in accounting and metric definitions** amongst private companies. The earlier stage companies may define and do things VERY different so the data is less reliable.
- **Very different firmographics** of companies in data set. Understanding who

Manage

Reject

Accept

For example, I referenced a recent GTM report from ICONIQ above. ICONIQ produces some of my favorite private company software reports. But it's important to remember that ICONIQ's investment portfolio is comprised of super high growth backed companies (they get some of the very best companies in the world). It is probably not very relevant to a bootstrapped company or highly profitable company that has a goal to be acquired.

### **Benchmarks Lag:**

Like all benchmarking reports, the data is lagging because it is reporting on historicals. In a quickly changing environment, companies should understand the benchmarks but also consider how things are changing and adapt to where you want to be (not where other companies have been).

In today's fast pace and quickly changing environment with generative AI, companies need to skate to where the puck is going, not where it was....otherwise they will be left behind. Benchmarks are informative though on trends, but just realize things can change quickly and they may not indicate where you want to be.

## **Concluding Thoughts**

My constant reminder on benchmarks: **Make sure you understand what you are comparing.** I see way too many people blindly compare to some irrelevant benchmarks.

For private companies, ask your investors for benchmarks most relevant to your company. They have lots of data and can share anonymized portfolio company data and/or provide insight on where they think you should be.

Understand the benchmarks, but skate to where the puck is going and not where it has been.

From the vantage point of a ~25M ARR bootstrapped SaaS company; we've also s  
dip in NRR like you've outlined here, largely from a significant drop in expansion c  
to prior years. Great job collecting all this data and packaging it into a quick, easy  
understand post so at least we know we're not alone.
